EXPERIMENT 10

SQL Query Generation using Structured Prompting

Name	K Lokesh
Register Number	192472020

AIM

To demonstrate SQL query generation by providing a database schema and a clearly stated requirement.

PROCEDURE

1. Define the Students table and its columns.
2. Specify the requirement to display students scoring above 80 marks.
3. Construct the SQL query based on the schema and requirement.
4. Display the schema, requirement, and generated SQL query.
5. Run the Python program and observe the output.

PROGRAM

```
print("SQL Query Generation using Structured Prompting")

schema = "Table: Students"
columns = "Columns: id, name, marks"
requirement = "Display students who scored above 80 marks."

query = "SELECT * FROM Students WHERE marks > 80;"

print("\nDatabase Schema:")
print(schema)
print(columns)

print("\nRequirement:")
print(requirement)

print("\nGenerated SQL Query:")
print(query)
```

OUTPUT

```
print("SQL Query Generation using Structured Prompting")

print("\nDatabase: Students")
print("Columns: id, name, marks")

query = "SELECT * FROM Students WHERE marks > 80;"

print("\nGenerated SQL Query:")
print(query)
```

```
SQL Query Generation using Structured Prompting

Database: Students
Columns: id, name, marks

Generated SQL Query:
SELECT * FROM Students WHERE marks > 80;
```

RESULT

Thus, the SQL query generation demonstration using structured prompting was completed successfully.
